RIPTIDE TRADING

Turning the tide on Plastic Pollution

Post Box Instruction Manual

Step 1

Lay out all the small 3D Letters, take care to ensure they are all the same way up. Notice in the 1st photo the D & N are lighter than the rest of the letters.

Step 2

Lay all the panels out in the correct order, starting left to right.

Back Panel, left panel, front, right panel. The right panel has my logo engraved.

Step 3

Using a Mitre Bond glue, (Glue + Activator) soft assemble the front panel and the Left panel together.

Then Get the Notched floor panel and glue along the bottom where the panels

meet.

Once the floor of both Front & Left Panel is glued, spray activator and repeat along the vertical edge.

Step 4

Now place the right panel against the face & floor panel. Before gluing the panels, place the lid on top with the hinges in the holes.

Once the lid is sat inside the hinge holes, glue and spray the activator along the edges of the panels.

Step 5

Once the Floor, Front, Left and Right Panels along with the Roof is all assembled, its very easy to glue the back panel on.

Slot it in place, then from the inside run a bead of glue where all the panels meet and along the floor. Spray the activator and hold for 10 seconds.

From this point you can flip the box over, and glue the letters etc in place. The engrave on the front panel shows where to place the letters.

Thank you for buying a post box,

Edward
